

NELES® HIGH CAPACITY TRIPLE ECCENTRIC DISC VALVE, METAL SEATED NELDISC® SERIES L6

Metso's Neles series L6 is a double flanged metal seated Neldisc® triple eccentric disc valve with one piece body design, for both control and tight shut-off applications. It is particularly well suited for the refining, power, petrochemical and chemical industries.

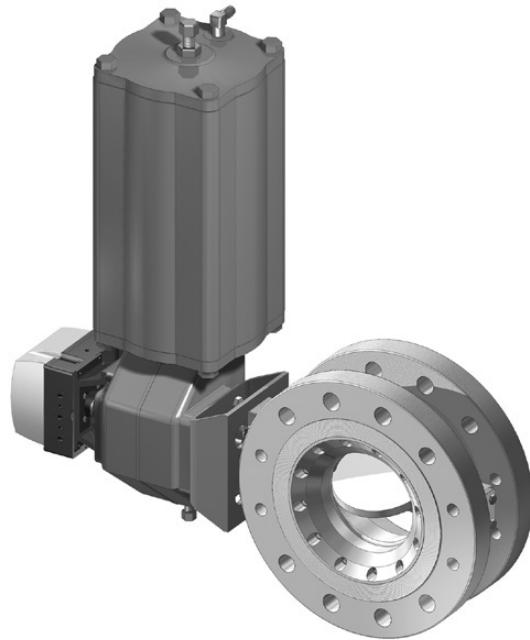

The L6 incorporates the Neldisc® triple offset metal seated design, which provides extended operational life in control, tight shut-off, high cycle, high temperature and abrasive applications. S-disc flow construction expands application possibilities beyond those of typical butterfly valves. Full rating from ASME 150 to 600 makes the L6 a sound control or shut-off valve and an ideal replacement for gate valves.

Excellent on-off capabilities

- Uniquely functioning full metal seat design assures tightness over long time periods.
- Contact between disc and seat is mechanically induced and does not rely on assistance from differential pressure.
- Bi-directional long term tightness is maintained even in high cycle rate services. Unidirectional in ASME Class 600. Tightness is not compromised by large thermal cycling either.
- Low friction and excellent wear resistance.
- Lowered operational torque reduces actuator size
- Heavy-duty stem and bearings arrangement extends service life and is insensitive to thermal cycles and impurities.

Excellent flow control capabilities

- Good controllability via smoothly rising installed characteristic curve at both very small openings and nearly full Cv positions. L6 provides very wide rangeability in fairly low pressure drop services.
- Good dynamic stability in both flow directions.
- S-disc design provides dynamic torque balancing and noise abatement, allowing L6 valve use in applications where high performance butterflies could not typically be considered. This offers very cost effective control solutions.
- Available with a variety of actuators, positioners and accessories for single source responsibility.

Abrasion resistant

- Solid, sturdy all metal seat design is based on metal-to-metal contact. No resilient parts are needed for seating. Furthermore, there are no resilient parts exposed to the medium.

Wide pressure and temperature range

- Differential pressure/temperature ratings in accordance with ASME B16.34.
- Standard construction performs equally well from -200 ...+600 °C / -328 ...+1110 °F.

Low cost of ownership

- Extremely high cycle life minimizes the need for maintenance, and increases Mean Time Between Failure (MTBF).
- Interchangeable seat can be replaced without disassembling the disc and shaft. Seat replacement does not require any adjustment or special tools. Seat design is exactly the same in ASME class 150 and 300 regardless of pressure rating.

NELDISC TRIPLE ECCENTRIC SEATING PRINCIPLE

The disc of the valve is machined to close tolerances, to create an elliptical shape, similar to an oblique slice taken from a solid metal cone. When the valve is closed, the elliptical disc at the major axis displaces the seat ring outward, causing the seat ring to contact the disc at the minor axis. The seat ring is able to move freely (except ASME Class 600) in a plane in its recess, to accommodate the disc in an optimal manner. When the valve is opened, the contact is released, and the seat ring returns to its original circular shape.

Conventional butterfly valve flow

S-DISC flow

S-DISC design offers stable flow control, reduced dynamic torque, noise level and vibration. For more information see technical bulletin 2SL120.

Not recommended mounting position coding for valve-actuator unit if using S-disc: A-HL, B-HL, C-HL and D-HL.

CONSTRUCTIONS

Standard

Fire-tested construction in accordance with API 607, 4th edition and BS 6755 part 2, is standard. Standard design also carries a live loaded stem packing.

Cryogenic

L6 is an excellent valve for cryogenic applications, temperatures -200 ... -46 °C / -320 ... -50 °F. Tight sealing over a wide range of cryogenic temperatures is accomplished with a high nickel alloy seat which maintains its mechanical properties even at cryogenic temperatures. The testing of the cryogenic valves is done in the Metso cryogenic laboratory in Finland. The testing procedure is agreed together with customer to fulfill the available standards and requirements.

Abrasive

The disc can be protected against erosion by HCr plating or cobalt based alloy. The shaft is protected by special bearing bushings and can be flushed with a purge.

High temperature

Service temperatures above +425 °C / +800 °F require high temperature construction with cobalt based alloy bearings and high temperature alloy shafts and seat. +600 °C / +1110 °F, consult the factory for proper material selection and higher temperatures.

NACE

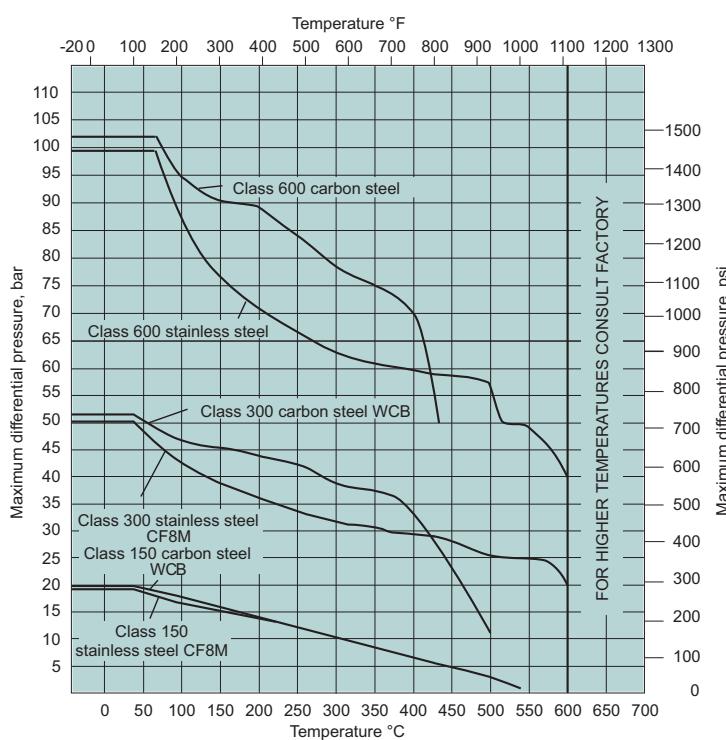

L6 Neldisc valves are available to comply with NACE MR 0103 or NACE MR 0175.

Steam jacket

For applications requiring constant higher temperature levels, the L6 valve can be equipped with steam jacket to prevent e.g. liquid sulphur to crystallize. The bearing area is protected by an O-ring to prevent contaminant particles from entering the bearing and packing area.
